

CHAPTER 6

SUMMARY, CONCLUSION, AND RECOMMENDATIONS

6.1 Summary

This capstone project produced SIYAM: A Cross-Platform Shelter Inventory and Audit Management System for Dumaguete Animal Sanctuary (DAS). The system was developed to replace the sanctuary's manual logbook-based stock recording with a role-based digital platform for Manager, Staff, and Donor users. In practice, it covers inventory and stock movement, ordering and replenishment support, animal records, treatment logging with linked supply use, donation submission and tracking, alerts and notifications, reports, an audit trail, and a donor portal for donation activity and impact information.

The application was developed using Flutter and Dart, with Supabase providing cloud authentication and database services. Consistent with the implemented system repository, SIYAM is delivered primarily as a Flutter Web application and also includes an Android build target. The web application is hosted on Vercel for production use.

6.2 Conclusion

The project has met its objectives. SIYAM automates stock tracking in place of manual logbooks, provides donation tracking and history, links treatment records to inventory updates and animal medical information, applies automated threshold-based inventory monitoring, offers reporting on inventory usage and resource consumption, and gives authorized users accessible, up-to-date information on stocks, animals, and treatments.

In conclusion, SIYAM provides Dumaguete Animal Sanctuary with a working inventory and audit management system suited to its documented operating needs. Within the project's stated scope and limitations--such as internet dependence and the absence of payment, procurement automation, and clinical charting features--the system offers a practical means of recording, monitoring, and reviewing sanctuary supply and care-related activity.

6.3 Recommendations

The application is ready for deployment. It is therefore recommended that Dumaguete

Animal Sanctuary use SIYAM in its regular operations so that managers, staff, and donors can rely on the system for inventory control, treatment and donation records, and operational reporting.
